productivity

Supplier
consolidation

The Solution: Invend™

Following a review of industrial consumable usage on site, our implementation team installed two banks of two carousel-style Invend™ machines within easy to access locations.

Invend™ takes care of everything for you. When stock is running low, each Invend™ machine automatically registers a replenishment notice, ensuring they don't run out before they can be restocked and so mistakes don't happen during the reorder process.

As a vendor managed service, we'll fill your machine, set it up and create users and employee access via unique PIN codes. Products are available when and where you need them and comprehensive usage reports ensure greater traceability of your consumables.

In any industrial or manufacturing plant, fast moving consumables are essential but often require a level of management that can be time-consuming and costly. Such as taking the time to walk to stores, waiting to be served and returning to work stations. Our customer, a UK leading supplier of meat and poultry products, introduced our Invend™ industrial vending solution achieving cost savings of £14,000 in less than 12 months.

The Challenge:

In a drive to improve production efficiency, the customer required an alternative to their remote stores location to reduce the need to walk long distances to retrieve a range of items including cutting tools, lubricants and PPE. In addition, the customer was looking to achieve greater visibility over product usage.

The Outcome:

The customer achieved cost savings of £14,000, with no time wasted visiting stores, a reduction in average monthly inventory spend and the cost savings associated with supplier consolidation.

By introducing Invend™, our workforce now have consumable products at the point of use, reducing walk and wait times. Plus Invend™ has also delivered significant reductions in consumable spend and provides all the reporting needed putting us back in control."
